DESCRIPTION

DynaBoost, formerly named YCH 702, is a flowable whirlpool hop extract at room temperature that is produced through supercritical extraction of hop pellets with CO_2, utilizing a proprietary extraction technique. DynaBoost is designed to increase both hop aromatics and hotside yield. It is most effective when used in the whirlpool. DynaBoost contains 35-50% alpha acids, 10-20% beta acids, and 18-22% total oil. DynaBoost is produced from single hop varietals to deliver variety specific flavors to your beer.

PACKAGING & STORAGE

DynaBoost is available in 1 kg and 10 kg HDPE containers. In general, these containers are equivalent to 10 and 100 kg (22 and 220 lbs) of T-90 hop pellets. DynaBoost should be stored below 25°C (77°F), though as with all hop products, aromatic quality will remain more stable at cooler temperatures, as low as -1°C (30°F). Under these conditions, DynaBoost will remain shelf stable in closed containers for two (2) years. Storage stability does vary per variety and can be negatively affected by exposure to oxygen, heat and/or light.

APPLICATION & USAGE

DynaBoost is designed to maximize aromatic contributions and yields in the whirlpool. While the alpha acids present will provide some bitterness, DynaBoost's strength comes from its high concentration of beer-soluble compounds. When dosed into the whirlpool, these 'survivable' compounds have a high chance of making their way into the final beer. Additionally, since there is no vegetal matter present in DynaBoost, when it's used to replace T-90 pellets, there should be significantly less trub produced in the whirlpool, resulting in higher beer yields. DynaBoost can be dosed directly into the whirlpool, as long as there is agitation. Higher retention of aromatic compounds can be expected at lower whirlpool temperatures, though active cooling of the whirlpool is not required. If product is stored in refrigerator it is best to warm to room temperature so product is flowable. Shake well to maintain homogeneity.

USE RATE CALCULATIONS

A typical dosage rate 0.2 to 0.5g per liter of wort is recommended depending on brewer's discretion. A typical replacement dosage for T-90 pellets with DynaBoost would be a 10:1 dilution, meaning for every kilogram of T-90 pellets, add 100g of DynaBoost. Unless whirlpool hops provide the vast majority of the bitterness in a given beer, the difference in bitterness pickup during whirlpooling is likely negligible due to lower isomerization rates as temperatures cool in the whirlpool. If a beer is largely defined by the bitterness generated in the whirlpool, bitterness can be adjusted with CO_2 extract, ISO, or another hop product.

AROMA

DynaBoost is variety specific, and will retain the same characteristics as the hops that went into making it. In general, when used as suggested, the aroma impact in beer should be very similar to a beer made with an equivalent dose of a traditional hop product. As always, final beer sensory notes will be dependent on many factors, such as addition time, temperature, and yeast choice.
